

Indiedimension — sign-up, sign-in and onboarding for a PWA ebook platform.

A US startup building a progressive web app for ebook "worlds" needed one onboarding experience that worked for four very different customers — readers, families, authors and publishers. I turned a spreadsheet of account rules into a complete flow and 39 wireframed screens.

Summary

Mission

Indiedimension was preparing a progressive web application where readers subscribe to ebook worlds, families share one account, and authors and publishers publish directly. The brief on Upwork was specific: design a visually appealing, user-friendly login and sign-up experience — wireframes, mockups and prototypes — that the development team could build from, optimised across devices and following PWA standards.

My contributions

I worked directly with the founder over two milestones. First, I translated the account-creation spec and the checkout / account-management notes into an end-to-end sign-up and sign-in flow chart,

Client

Indiedimension — early-stage ebook platform, United States. Engaged through Upwork on a fixed-price contract.

What I did

- Requirements analysis from client specs
- End-to-end sign-up / sign-in flow chart
- Onboarding wireframes (39 screens)
- Account-type & subscription logic
- Payment & family-member flows

covering manual and social login, OTP and authenticator verification, subscription choice, and the extra registration steps for family, author and publisher accounts. Once the flow was agreed, I wireframed every screen — 39 mobile screens across five groups — so the client could review the whole journey before any visual design.

Impact

The client got a single, agreed map of the entire onboarding journey and a screen-by-screen wireframe set ready for UI design and build. The contract closed with a 5.0 rating.

4

account types in one flow: individual, family, author, publisher

39

wireframed mobile screens across 5 groups

2

milestones: flow chart, then wireframes

My role

Freelance UX designer — sole designer on the engagement, working directly with the founder, project manager, business stakeholders, and the development and testing engineering teams.

Tools

FigJam (flow charts) • Figma (wireframes) • iOS-first mobile frames

Timeline

Jul 14, 2023 – Sep 21, 2024 • flow chart and wireframes V1.0 delivered July 2023

Client feedback

★★★★★ 5.0

Fixed-price contract, both milestones approved, completed with a five-star rating on Upwork.

Four customers, one front door.

The client's spec was a table of rules per account type. The design problem was making all four feel like one product while still collecting what each one legally and commercially needed.

READER

Individual

- Email, name, date of birth, password (12+ chars)
- Or Google / Facebook / Apple / Microsoft
- 2FA by phone or authenticator
- Explore Free or Library Member subscription
- Content filters; auto-restrict for 13–18

HOUSEHOLD

Family

- Up to 5 members including the owner
- Roles: co-owner, adult, child
- Purchase approval for members and under-13s
- Parental controls and per-member filters
- Credit card required

CREATOR

Author

- Must be US-based
- Business entity or individual (SSN / Tax ID)
- Business type, address, state of incorporation
- List of published properties
- How to accept payment

BUSINESS

Publisher

- Same registration as author
- Publish ebooks, create worlds for authors
- Content-management and plagiarism consent
- ISBN and copyright checks
- Payment setup

Milestone 1 — the flow chart.

Before any screens, one board that the founder and the developers could agree on. Sign up and sign in run in parallel, both pass through OTP or authenticator verification, then converge on "choose subscription" — which is where the four account types split and rejoin at the home screen.

Sign Up / Sign In flow, V1.0 (July 2023). Green = success, red = failed, purple = decision; the loops at the bottom are the periodic re-verification and "already signed in" sessions.

The working board — the earlier, messier version where the rules were still being argued out with the client.

DECISION

Social login first, manual second

Google, Facebook, Apple and Microsoft sit above the manual form. A social sign-up skips the password rules and pre-fills name, email and birth date into a "verify your details" step instead.

DECISION

Verify before you choose

Phone OTP (or an authenticator app) happens before subscription choice, so a family owner or author never gets deep into registration on an unverified account.

DECISION

One convergence point

Every account type meets again at "registration completion" — address, card, phone permission — so the payment and family screens are shared, not duplicated four times.

DECISION

Age gate in the data, not a wall

Birth date is captured once at sign-up and drives filters and purchase approval later, instead of a separate "are you over 13?" interruption.

Milestone 2 — the wireframes.

Thirty-nine mobile screens in five groups: sign in / sign up, choose membership, payment, add family member, and author / publisher registration. Greyscale on purpose — the client was reviewing structure and copy, not colour.

Onboarding wireframes V1.0 — the full board, 28 July 2023.

Sign in, sign up and verification

Sign in / sign up — four social options above the manual form.

Native account picker for social sign-in.

Phone number for OTP, with country code.

Six-digit OTP with a retry timer.

Details, subscription and payment

Verify details — pre-filled from the social account, editable where allowed.

What this project taught me about freelance work.

Agree the flow before drawing a screen.

Splitting the contract into "flow chart" then "wireframes" meant every screen debate had already been settled on the board. The second milestone went faster than the first.

A spec table is a research artefact.

The client's account-creation matrix told me more about their business model than any interview would have — who pays, who needs approval, who must be US-based.

Greyscale keeps the review honest.

Reviewing 39 screens in wireframe kept the founder's feedback on structure and copy, not button colours.

Shared screens beat duplicated ones.

Four account types could have meant four onboarding flows. Finding the convergence points kept it to one, with branches only where the data differed.
