

Phishing Simulation — an enterprise application for cybersecurity compliance.

Designing the phishing simulation capability inside LRN Catalyst from the ground up: campaign creation, a reusable template library, simulation configuration, and the analytics that turn employee behaviour into measurable risk.

Summary

Mission

LRN Catalyst is a SaaS platform that helps organisations manage ethics, compliance and risk programmes — delivering training, managing policies and regulatory requirements, monitoring risk and employee behaviour, and strengthening ethical workplace culture. It supports 3,000+ organisations globally. The brief was to design the end-to-end phishing simulation experience within Catalyst, so security teams could create campaigns, manage phishing templates, configure simulations and analyse employee behaviour through reporting dashboards — without leaving the platform.

My contributions

Client

LRN Technologies & Content Solutions — the Catalyst ethics, compliance and risk platform

What I did

- Discovery with PMs & stakeholders
- User journey mapping
- Campaign creation workflow
- Phishing template library
- Simulation configuration UX

I was responsible for designing the phishing simulation capability from the ground up — a 0 → 1 product inside an established platform. Working closely with Product Managers and Engineering, I defined the product experience, translated requirements into scalable workflows, and made sure the result was usable by security and compliance administrators who are not necessarily technical. That covered the campaign creation workflow, a reusable phishing template management system, simplified configuration settings, and the reporting flows, from concept through to launch.

Impact

Catalyst Phishing replaced third-party tools with an integrated capability: campaigns, templates, training triggers and reporting in one place.

0 → 1

product designed from concept to launch

50+

reusable phishing templates modelled on real scenarios

4 stages

create → template → configure → monitor

3,000+

organisations on the Catalyst platform

- Reporting & analytics dashboards
- Wireframes → hi-fi → prototypes

My role

UX Product Designer — 0 → 1 product design, in partnership with Product and Engineering.

Tools

Figma (wireframes, hi-fi, design-system components) · FigJam (journey mapping, brainstorming) · Figma Make (UI generation, component suggestions, iterations)

Timeline

2023 – 2025 · Shipped

The problem: phishing lived outside the platform.

The organisation relied on third-party phishing simulation tools. They worked, but they created four recurring problems for the people running them.

01 Complex campaign setup

Security administrators had to work through multiple complicated steps to configure a campaign, making the process time-consuming and hard to manage.

02 Limited template reusability

Phishing email templates often had to be recreated for every campaign, adding operational effort and reducing efficiency.

03 Fragmented workflows

Running phishing outside Catalyst meant switching between systems, which broke the administrator's flow and separated phishing from the rest of the compliance programme.

04 Limited behavioural insight

Existing tools focused on awareness training rather than measuring real employee behaviour, so risk patterns were hard to identify and security outcomes hard to improve.

The result: administrators struggled to manage phishing simulations efficiently and to connect campaign outcomes with broader compliance training initiatives.

The third-party tooling administrators were using before Catalyst Phishing.

Design process

An iterative loop of discovery, ideation, prototyping and validation — each round narrowing the workflow before anything went to high fidelity.

01

Discovery

Worked with product managers and stakeholders to understand phishing simulation workflows, user needs and platform constraints.

02

Ideation & wireframing

Low-fidelity wireframes to explore campaign creation, template management and reporting structures.

03

Prototyping

Interactive prototypes to visualise user flows and refine usability before build.

04

Validation

Tested with internal stakeholders and engineering to make sure the solution was intuitive, scalable and aligned with user needs.

Who we designed for.

Two administrators with the same screen and different questions: one runs the campaigns, the other has to answer for the results.

Michael Carter — Security Administrator

Austin, USA · 38 · 12+ years in cybersecurity & security operations

GOALS

- Run phishing simulations across departments
- Identify high-risk users and teams
- Monitor employee responses to phishing attempts
- Improve overall security awareness in the organisation

PAIN POINTS

- Complex campaign configuration
- Recreating phishing templates for every campaign
- Limited visibility into employee behaviour
- Difficulty managing multiple campaigns simultaneously

DROVE THE CAMPAIGN WORKFLOW & TEMPLATE LIBRARY

David Okafor — Compliance & Risk Manager

Austin, USA · 42 · 15 years in compliance & risk management

GOALS

- Improve employee security behaviour
- Track phishing training outcomes
- Monitor organisational cyber risk
- Ensure regulatory compliance

PAIN POINTS

- Lack of clear behavioural insights
- Difficulty linking phishing results with training programmes
- Limited reporting for compliance tracking
- Hard to identify high-risk departments quickly

DROVE THE ANALYTICS & TRAINING INTEGRATION

Campaign creation workflow.

Simplifying campaign creation was the core design challenge. The final workflow has four stages, and templates and user groups are reusable objects, so the second campaign is faster than the first.

STAGE 1

Create campaign

Administrators define the campaign details:

- Campaign name
- Target audience
- Simulation schedule

STAGE 2

Select or create template

Choose from 50+ phishing templates modelled on real scenarios, or create a custom one. Templates are reusable across campaigns.

STAGE 3

Configure simulation

Settings that make the simulation mirror a real threat:

- Landing pages
- Simulation difficulty
- Target user groups

STAGE 4

Monitor results

Built-in analytics dashboards that surface:

- Click rates
- Credential submissions
- User-level behaviour insights

FigJam journey maps: the administrator's campaign flow (top) and the employee's path from phishing email to training assignment (bottom).

The solution: Catalyst Phishing.

An integrated phishing simulation capability inside Catalyst, built to help organisations run smarter campaigns.

01 Real-world phishing simulations

Simulations mirror modern phishing attacks and social-engineering tactics rather than generic email lures.

02 Behaviour-based training

Training is triggered when risky behaviour is detected — clicking a phishing link or entering credentials.

03 Integrated platform experience

Campaigns, templates and reporting are managed directly within Catalyst, eliminating third-party tools.

04 Flexible campaign management

Administrators run campaigns using 50+ customisable templates based on real phishing scenarios.

Key features

Real-world simulations

Behaviour-based training triggers

Flexible campaign management

50+ ready templates

Built-in reporting & user tracking

Microlearning security training

Multilingual delivery

Security & privacy compliance

Seamless platform integration

The final solution.

Campaign management dashboard

A centralised view of every campaign — status, phishing-prone metrics, user groups and timelines — so an administrator can see the whole programme at a glance.

UX IMPROVEMENTS

- Clear campaign status indicators for quick monitoring
- Structured data table for improved readability
- Search and filter for faster campaign discovery
- Action controls for quick campaign management
- Simplified navigation within the phishing module

Asset library

Lets administrators manage and organise the assets used to run campaigns — pre-built phishing templates, landing pages and "phished" pages — in one place.

- Centralised asset library
- Asset categorisation
- Multiple asset views
- Quick asset creation
- Usage tracking

Create Phishing Campaign — target audience, training assignment and delivery schedule in one guided screen.

Campaign insights & user-level tracking

A detailed view of campaign performance and individual responses. Administrators can monitor activity, track how employees interact with phishing emails, and identify high-risk behaviour across the organisation.

KEY FUNCTIONS

Campaign overview

Phishing risk indicator

Organisational risk score

Engagement & training metrics

Campaign performance analytics

Recent activity

Template selection

Training assignment integration

User-level behaviour tracking

Data export & analysis

Organisation-level risk on top; individual campaign data below.

Live production screens.

What shipped inside Catalyst – captured from the live product.

Phishing sits in Catalyst's main navigation – Campaign, Simulation and Dashboard, no third-party tool.

Campaign list: status, phishing-prone %, user group, dates, quick actions – and the Phishing Setup menu for user groups, sender domains and red flags.

Asset library: 120 library bundles by phishing type, brand, difficulty and language, with usage counts across campaigns.

Template preview & edit: email, landing page and phished page in one modal, with the exact inbox rendering and a "show red flags" toggle for training.

Create Phishing Campaign

Fields marked with an asterisk (*) are required.

Once a campaign starts, you cannot modify the module selections.

Set Campaign Name and Frequency

Campaign Name *

Enter a name for this campaign

Supports alphanumeric and special characters. Max length 100 characters.

Description

Optional description for this campaign

Supports alphanumeric and special characters. Max length 1000 characters.

Campaign Frequency *

☒ One Time ☐ Every 2 Weeks ☐ Monthly ☐ Quarterly

End this campaign on

Select Phishing Bundle

We recommend selecting more templates to match campaign frequency and randomization.
